

X-1

By : **hari98**

This Novel is combination of Destruction of Universe Scientifically with very advanced technologies and with a good sequel of tough job of the protagonist who is also a scientist to disable the entire mission plans made by the antagonist.

X-1 : Chapter 1

X1

THE GREEN LOCK

What triggered the Dinosaurs, the wicked creatures on the Earth to be defunct? Of course it is all because of cosmic Deforestation initiated by an Asteroid striking the Earth at bewildering level. Boundless hypothetical impact on this Evolution! What if the same deforestation (let me make it as a very small area with a minor cause of it, however the reaction would be as what I expect) could be caused for a new destruction of the entire Universe and not just the world artificially? By the time I start my first mission, I would also be in a position to firm up my plans of my living after the destruction. Only, if I exist, I could destruct, if I also die along with others, there's no use of creation of devastation. Let some parts of my conception be suspense and continue with my programmed missions.

It all matters about energy at present and in the future. And that's what this operation is altogether about. I am Vincent Fetcher Glad, Welcome guys! Trail the Eye of it. X1, simply with science!

Northern U.S.A.

De Facto, if we wanted to recognize the progression of inserting rays and defining the Prothallus, we could say scientifically that, once when he injected his first Ray into the plant body, the ray goes inside and destructs the Prothallus of the plant thereby slowly destructing the Plantae Kingdom. For this, we need to know what is called a Prothallus. The small, greenish heart-shaped structure or gametophyte (N-Haploid) of a fern that produces the male and female gametes for fertilization and spore formation which leads to the development of the sporophyte generation--(2n-diploid) --> the plant you see above ground is the sporophyte generation, this is known as a Prothallus which plays an important role in reproduction. Now we come to know that because of the Rays sent inside, the Plant Reproduction will slowly reduce thereby creating an incomplete cycle in the nature drastically. There is one important thing to note down here, that is, the Rays which are injected / inserted inside, they contain in-built Highly Inflammable Micro - Processors Electromagnetically made up of and they are invisible and they work chemically.

This is because, if once the reproduction stops, then the number of plants and its own natural varieties get reduced and some soon get affected by spreading of this ray from each other as planned earlier by Mr. Glad. If all these happens, then there would not be any inhalation of CO₂ (Carbon Dioxide) or exhalation of O₂ (Oxygen) which first mainly, of course terribly affects the Respiratory Functional Organs in each Terrestrial Living Species. Automatically, the temperature gets heated up as a result of drastic increase in the present day Global Warming. This allows heating up the entire world and causing related diseases. After which the extreme level of tolerance by each Species for High Temperature would be uncomfortable and insufficient. If this single CDR - BIMX Ray could change the entire Nature, then think what if he spreads with each and every plant variety with each Ray without any actual human or nature influences and permissions. This would adversely affect the Human Beings especially if the limit crosses out.

When the Nature's Cycle is turning out to be incomplete, if the incomplete part is not replaced with, then: "Everyone sails at the same Boat" for sure. This process is just for injecting a Ray. The main part is not yet enlightened to you all.

½We didn't see about the Electromagnetic & Radioactive Waves Respondent (ERWR). The ERWR means, through electromagnetic and radioactively, there are some wireless minor connections which also plays an important role here. Since this Respondent is activated with the communicable Ray electromagnetically, they have a wireless High Contact for instructed operations which are to be done by Mr. Glad; they are very advanced like Nano-robots and Nano-species. Mr. Glad also fixed 52 different assortments of Hologram Cameras which have resolution maximum up to 5000 Mega Pixels (MPs) with Micro - Zoom Processors (MZIP) High Definition Quality (HDQ) built-in. Since they are Hologram structured cameras, he could access it invisibly without the knowledge of anyone; even those 52 different cameras were built in such a way that they get charged up from built-in Mini Solar Panel with Water resistance. They place on top of each tall tree that suited those cameras to set in.

As discussed earlier, the Radio-active waves transport the needed messages sent through Mr. Glad's Nano-computer to Sensor R-7.6 present inside the Prothallus. It was also inserted along with chemical Rays separately. Reflexively speaking, it was all mechanical and technological. Since the transmission would be difficult enough to transmit from Chicago City to Coastal Islands of Cuba with a vast distance, he sensitively kept 5 equal kinds of Wave Receptors through which each transmission takes places by passing between each receptor without any disturbance. For this, he planned the altitude for each receptor though it wasn't possible to be like satellites roaming around nearby the Earth in the Space. Hence, he decided to keep these receptors in the mountainous regions where each private condition suited accordingly.

Everything suited well and it was unrelenting to be as it was while starting the Mission.

It was 6.03 PM at the evening; the day was 29th January 2013. Well, here emanates our new Charm. Mr. Glad meets his longtime workmate who lives in New Castle, Ireland, United Kingdom (UK). His name is Dr. Dafoe Croc. Edison. They both had a nice time talking and sharing their experiences with each other for about an hour and it was 6 minutes before 7:30 PM at the night. They decided to start off with their technical project(s).

They gave wireless electrical connections from their Laboratory to Islands of Cuba beneath the sea level through a funnel for electrical transmissions. This would be effective from the next mission meanwhile, the construction and preparations were held. However, Mr. Croc and Mr. Glad both had to go in the deep blue sea to fix a Sea-route Sensor somewhere in the mid-route. The name of the island was "Cayman Islands".

Luckily, he had a support of Mr. Croc to make his tactics come to light sequentially. That day went on just like that. Yet, there was a step incomplete. He did everything correctly but he forgot to give a command electrically that, the ray must not hit each other with the ERWR since they were added separately afterwards. If they collide with each other, then the process will remain as error and will deviate from the actual process which would cause violent penetrating combinations for destruction. As a result, he first got up at the midnight around 11 O'clock and gave the command. It was not accepting when he gave the command and he got scared in a fraction of second. Then, he tried again and again, but still he couldn't identify his mistake where he had gone wrong and wanted to correct as soon as possible. Finally, the mistake was that, the connection plug-in was disconnected. It was actually careless while some risky plans are undertaken by someone especially by such advanced technological ones. He connected and he re-commanded and restarted the entire program. It was finally done with a little fire in Mr. Glad's Eye which was reddish in color. Mr. Croc's "Croc-Play" began from the upcoming missions.

"Thank God, Uh!" said politely Mr. Glad and slept away.

"Qua-Qua-Qua..." said Mr. Croc while sleeping next to Mr. Glad. Mr. Glad got disturbed and he could sleep partially only since Mr. Croc was behaving funny with his noisy voice.

Now that, he had already injected the Rays and they too had started working, the case here slowly becomes severe for the reproduction of Plants, especially varieties of Ferns. If we need to look into it very deeply, then we could actually observe that, first, the ray inside starts to distribute automatically the chemical ERWR equally and the chemical compounds and liquefied molecules of ERWR subdivide among themselves; they freely start moving towards the extreme insides of Xylem and Phloem respectively as instructed punctually by Mr. Glad to be performed well enough. Third, now once they get settle in their own places after dividing among themselves, these chemicals mix with the materials carried inside by both Xylem and Phloem thereby travelling to the entire part of the plant body and finally to the humus of the soil without any big strain. Fourth, when they travel to each part of the plant bodies, each molecule or compounds or whatever extra present inside them are transmitted automatically: when transmitted, each released chemical substance go on their own path and try to break through each cell organ of a plant and enter inside the Cell Wall and the Cell Membrane of the cell and get inside roaming around in the Cytoplasm to reach the main Nucleus. Like this each chemical substance released from Xylem and Phloem tubes of a plant from each cell of the plant, they perform in a very uniform way through ERWR wireless network transmission received from Mr. Glad. Fifth, once the enter inside the Nucleus of the Cell, they try to destruct the Cell as a result of bringing it under the Chemical control, that is, under Mr. Glad's control.

He viewed all these through the Microscopic Lens of Hologram Camera as mentioned about it earlier live in his own system spared no additional expense. Sixth, the final step to be illuminated is a little complicated long process which keeps dragging a lot to end the setup process, that is, once when each cell of each plant in total is brought uniformly under perfect security control by Mr. Glad without any instabilities, they require some amount of energy and various kinds of transmitting devices to be used and not simply with an injector, camera and some wireless network devices, but more than these, a lot needs to be brought in order to finish the sixth

step process, that is, the final setup ending and otherwise it isn't possible to do so.

The next day, with next idea, wit next process, with next, next and next... What was that? Was it the sixth step? What is it all about? We'll see that in the following Missions of Mr. Glad with his best friend, Mr. Croc and with lot of additional complex processes that are yet to be done!

MISSION 2: THE SIXTH TRANSFORMATION

Well, 5 steps have gone ahead of us in the earlier mission and now this probably must continue from the sixth one, and not just continue, but to end the setup process for activity the first and the second missions of Mr. Glad. It would be dragged way beyond what we could imagine and that is this Mission. Not only the end of the setup, but the growth of destruction activities because of chemicals which are supposed to be entering the soil and spreading it out wherever possible and necessary...
